Week 5 Starter Project: UML Class Diagram

This diagram reverse-engineers the verified structure of the attached Week 5 starter project. It shows the two production modules, application shell, seeders, public Student lookup contract and Razor-view groups.

PlantUML

Interpretation Notes

- `StudentService` implements `IStudentLookup`, which is consumed by the Academic Supervisors module.
- `StudentStorage` owns the Student collection, while `AcademicSupervisorStorage` owns supervisor and assignment collections.
- `StudentDataSeeder` and `AcademicSupervisorDataSeeder` are separate from storage, and the Academic Supervisor seeder depends on the Student lookup contract.
- The test project contains seeder, storage, and service tests plus `FakeStudentLookup` and fixture data.
- Razor views are grouped to keep the class diagram readable. Individual view filenames are recorded in diagram notes.
